These include</p> <ul style="list-style-type: none">• mis-specifying the size of a buffer or the amount of data to be written. Off-by-one errors are common.• failing to plan for correct behavior when input is larger than expected.• assuming the wrong semantics for a parameter that controls data transfer and prevents buffer overflows. Because various functions use the buffer size, buffer size minus one, the remaining space in the buffer, etc., it is important to understand the bounding semantics for each function. <p>In the context of strings:</p> <ul style="list-style-type: none">• Failing to allow space for a terminating null character.• Failing to ensure that a terminating null character is present; many standard functions consistently experience this failure.

Method of Attack	Bounds checking and off-by-one errors create opportunities for buffer overflow or denial of service attacks.		
Exception Criteria			
Solutions	Solution Applicability	Solution Description	Solution Efficacy
	Always	Always use #define or other const for declaration of size	Effective to the degree that consistent care is used.
	Always	Always use SAME #define or const when checking bound sizes	Effective to the degree that consistent care is used.
	Always	For strings, use (buffer size) - 1 to ensure space to put terminating \0	Effective to the degree that consistent care is used.
	Always	For strings, always write a \0 to upper bound the buffer after processing a string	Effective to the degree that consistent care is used.
	Always	Do a bounds check to verify that the buffer you are passing in is as big as you say and that it is big enough to hold the new contents. Verify that the returned buffer is null terminated.	Effective to the degree that consistent care is used.
	Always	Identifying or writing safer versions of utility functions which incorporate checks, and then using these safer functions consistently	Effective to the degree that consistent care is used.
